method signature

(concept)

Java phrase : "Method Signature"

Method Signature is a method name along with the number, type, and order of its parameters. It is used to bind a method invocation to the appropriate definition.

Two signatures may have the same number of parameters, as long as at least one of the parameter list types differs.

"return" type is not included in the signature, which means it is illegal to have two methods in the same class scope where the only difference is the return type.

Here is the example of the method signature:

```
int min(int a, int b)
```

The method min passes two parameters/signature : int a and int b

Rob's Notes

```
class TestSignatures
{
    /**
     * A method's signature is a combination of its name and
     * parameter list.
     */

    // Signature: methodOne ()
    public void methodOne () {}

    // Signature: methodTwo (int, String)
    public int methodTwo (int one, String two) {return 0;}

    // Signature: main (String [])
}
```

method signature

```

public static void main (String [] args) {}

// No! These ones won't compile

// Signature: methodTwo (int, String)
public int methodTwo (int two, String one) {return 0;}

// Signature: main (String [])
private ArrayList main (String [] listOfThings) {}

// Yes! These ones will compile

// Signature: methodTwo (String, int)
public int methodTwo (String two, int one) {return 0;}

// Signature: main (String)
public static void main (String args) {}

} // end class TestSignatures

```
